Guidance for improvement of building envelopes airtightness measures Title:

Scope: This Estonian national standard requires designers and constructors to select and implement

> measures to ensure the airtightness of building envelope structures during the construction of new buildings and the renovation of existing ones (including reconstruction, restoration, and repair). The goal is to prevent major air leaks in buildings under construction and renovation, ensuring low air leaks throughout the building. This improves both performance and durability, helping achieve the established objectives for energy performance and indoor climate. The standard presents a selection of measures for reducing air leakage. It is important to note that this list of solutions is not exhaustive; the air-tightness of boundary structures can also be achieved through other methods that have been studied and

documented. Given the unique features of each project and the intended use of the rooms,

design and construction should be approached on a case-by-case basis.

National Ref: ÖNORM S 5705

Title: Requirements for table-top LF for pharmacies - operation, maintenance and testing

Scope: This ÖNORM defines requirements for laminar flows in accordance with the Pharmacy

Operating Regulations 2005 - ABO 2005 (Federal Law Gazette II No. 65/2005). Every pharmacy must have at least one workstation in the laboratory for preparations with a laminar flow device according to the state of the art in science and technology. These devices are known on the market as "table-top laminar flow" (table-top LF) for pharmacies.

A table-top laminar flow device is a cleanroom device specially designed for the application requirements of pharmacists which protects these products (e.g. capsules, ointments, powders, drug mixtures, drug extracts, solutions, suspensions, emulsions, suppositories, especially parenteral preparations and eye drops) from contamination from the ambient air during the preparation of sterile medicinal products.

The interior of the devices has a protective area, which is ensured by suitable flow technology with a Hepa filter system and separates particle sizes in the range of 0.1  $\mu$ m (lower limit) and 5  $\mu$ m (upper limit). These devices are not designed for personal protection, but for product protection. Table-top LF devices are characterised by their small, compact design and are therefore suitable for applications requiring little equipment. Table-top LFs are not safety cabinets and are therefore not subject to the European ÖNORM EN 12469 standard.

Title: Indoor air - Part 3: Determination of formaldehyde and other carbonyl compounds in

indoor and test chamber air - Active sampling method (ISO 16000-3:2022)

Scope: This part of ISO 16000 is intended to characterise indoor air, whereby the sampling strategy

to be used is described in ISO 16000-2. It is applicable to formaldehyde and other carbonyl compounds and has been tested for 14 aldehydes and ketones. Formal-dehyde is the simplest carbonyl compound with one carbon, one oxygen and two hydro-gen atoms. In its monomolecular form it is a colourless, pungent smelling, reactive gas. It is used in the production of urea-formaldehyde resins, adhesives and insulating foams. Emissions from chipboard and wall insulation are the main sources of formalde-hyde in indoor air.

National Ref: ÖNORM ISO 16000-6

Title: Indoor air - Part 6: Determination of organic compounds (VVOC, VOC, SVOC) in indoor

and test chamber air by active sampling on sorbent tubes, thermal desorption and gas

chromatography using MS or MS-FID (ISO 16000-6:2021)

Scope: This document specifies a method for determining volatile organic compounds (VOCs) in

indoor air and in the air of test chambers and test cells to determine emissions from products and materials used indoors (according to ISO 16000-1). The method is based on the use of sorption tubes followed by thermal desorption (TD) and gas chromato-graphic (GC) analysis using a capillary column and a mass spectrometric (MS) detector with or

without an additional flame ion detector (FID).

The method is suitable for measurements of most GC-compatible gaseous organic compounds in the mass concentration range from micrograms per cubic meter to several milligrams per cubic meter. Many highly volatile organic compounds (VVOC) and semi-volatile organic compounds (SVOC) can be analyzed depending on the sorbents used.

National Ref: ÖNORM ISO 16000-8

Title: Indoor air - Part 8: Determination of local mean ages of air in buildings for characteriz-ing

ventilation conditions

Scope: This part of ISO 16000 specifies the use of a single indicator gas to determine the local age of

air as an indicator of ventilation conditions in a building. The methods include the concentration decay method and the homogeneous constant emission method. The

methods described are suitable for the following air quality studies:

a) Check whether the building ventilation requirements are met;

b) assessing whether building ventilation is appropriate to indoor air problems;

c) Characterization of the strength and distribution of the sources in the interior.

In principle, the methods can be used for all interior spaces, regardless of the ventila-tion methods and the mixing of air between the zones in the measurement object. The existing

ventilation conditions cannot be disturbed by the measurement.

Indoor air - Part 41: Assessment and classification (ISO 16000-41:2023) Title:

This document describes a procedure to classify the air quality of indoor spaces using quality Scope:

> classes. These quality classes enable the allocation of the room air to a high, medium or low quality. The quality classes are based on criteria for physical, chemical and biological parameters according to the state of science and research. These criteria can be both concentration values in the room air (e.g. with formaldehyde) as well as sensory and other findings in the room itself (e.g. with mould). The basis for classifying a measured value of a parameter in a quality class is the definition of class boundaries for quality classes A to C by national institutions, using guide values from national guidelines, European and international

publications and trade literature.

Title: Non-regulated professions - Professionals of farriery for equids - Knowledge, skill,

autonomy and responsibility

**Scope:** The standardization activity aims to define the requirements of the professional activity

related to:

- Farrier for equids;

- Farrier for equids' instructor.

These requirements will be specified, starting from the tasks and activities and the identification of their contents, in terms of knowledge and skills, also in order to clearly identify the level of autonomy and responsibility, in coherence with the National

Qualification Framework (QNQ). These requirements will also be expressed in such a way as to facilitate and contribute to make homogeneous and transparent, as far as possible, the

relevant conformity assessment processes.
